How to Get Some Varian Graphics: Part I

A. J. Desmarais
Development Division

MARCH 1981

This is an unreviewed manuscript, primarily
intended for informal exchange of information
among NMC staff members.

NMC's VARIAN Package

The VARIAN programs, developed by Automation Division, operationally provide graphics for data plots and contours from the various analyses and forecasts on several map scales and projections. The graphical products are made available to many users:

- (a) in-house hard copy from the VARIAN recorder,
- (b) facsimile transmissions to outside users,
- (c) display on the AFOS system, and
- (d) 35-mm film generated by OMCS Graphics Section.

Many researchers and programmers in NMC have a need to display the results from various impact studies, data evaluation tests, analysis and forecast models, diagnostic studies, etc. The operationally designed VARIAN package, however, has its limitations, is somewhat cumbersome to use, has many options, but produces excellent graphics. To minimize the difficulty in using portions of the VARIAN package in a checkout mode and in specifying the options, several programs and procedures have been generated for your use. But, remember, the package can not do everything one can imagine; it will always be up to the user to provide the necessary input files, in the correct format, for the options chosen. That is, observations for data plots have to be in NMC Office Note 29 format in sequential files; gridded fields have to be in Office Note 84 format and reside in random access disk files. The version of the VARIAN program described herein is a modification of the NMC operational program PEPFAX8. Other VARIAN products, like the Mercator strips, will be documented and made available at a later time.

Loading Data Files from Tape

If necessary input files are not already resident in disk files, one may use, for example, the NMC procedures NWSLDLFM, NWSLDOPL, or NWSLDFNL to extract the desired files from the NMC history tapes. These procedures will automatically restore observational data to sequential files on temporary disk and/or restore gridded fields to temporary random access files. User-generated fields in Office Note 84 format can be converted from a sequential file to a random access file by using the catalogued procedure SEQ2RA. (See Appendix A1).

Setting up the VARIAN Input Controls

The procedure VSETUP (See Appendix A1) requires two (2) input data cards that will be used to generate the necessary card input file for the VARIAN program. The user merely selects the type run (KRUN), the data plot control (IC), the output merge control (MP) as given in Table 1, and the desired map numbers for the given KRUN from Table 2 or Table 3. Additional map numbers can be added to Table 2 or Table 3 upon request (See Desmarais).

The file may be created by executing the procedure DATA20 or DESUAPAP (See Appendix A2 and A3). Notice that the output from both of these procedures will be on a temporary disk file with a DSN = &&FILI54, and is to be passed to the procedure VARIANX by setting the parameter ADP='&&FILI54'. By default, the VARIAN program will use an empty file for ADP.

The date/time of the ADP file to be created must agree with the GES file. If a GES file is not available, the user may create an empty but suitable (&&GES) file by executing the following JCL:

```
//GESER EXEC PGM=DESGESER
//STEPLIB DD DISP=SHR,DSN=NWS.NMC.DDIVDAB.LOAD
//FT06F001 DD SYSOUT=A
//GES DD DISP=(NEW,PASS),UNIT=SYSDA,SPACE=(CYL,1),DSN=&&GES
//FT10F001 DD DISP=(OLD,PASS),DSN=&&ADPUPA (or any other data file
                                         previously loaded)
```

However, there is no date/time test made between the ADP file and the analysis of forecast files. This permits one to display verifying observations on forecast displays.

Data plots are only permitted with certain maps combinations, namely,

- (a) Heights and relative humidity,
- (b) Heights and isotachs,
- (c) Heights and temperatures,
- (d) Heights and thickness,
- (e) Heights only.

Table 4. File Names, Run Markers, and Map Scales for the VARIAN Program.

<u>NMC RUN</u>	<u>Data prep File name</u>	<u>VSETUP KRUN</u>	<u>Scale</u>	<u>Random Access Files (DDNAME's) to be opened</u>
RADAT	1DOTFAX	RAD	1:40	ANL1, NEWPAP*, OLDPAP*
OPNL	NHEMI40	OPN	1:40	ANL1, F00, F12, F24, F36, F48, NEWPAP*, OLDPAP*
	SHEMI40	OPNS	1:40	" " " " " " " "
OVR48	NHEMI40	EXP	1:40	F60, F72, F84, F96**
FINAL	NHEMI40	FIN	1:40	ANL, GF12, GF24, NEWPAP*, OLDPAP*
	SHEMI40	FINS	1:40	ANL5, " " " "
LFM	2DOTFAX	LFM	1:20	FMANL, FMO0, FM12, FM24, FM36, FM48, NEWPAP*, OLDPAP*
1DOTFAX	1DOTFAX	PLT1	1:20	ANL1, NEWPAP*, OLDPAP*
2DOTFAX	2DOTFAX	PLT2	1:20	FMANL, NEWPAP*, OLDPAP*
SIRSPLOT	NHEMI40	PLT3	1:20	GF12
	SHEMI40	PLT3	1:20	GF12

*Optional --- only needed if height changes are to be displayed.

**Forecasts from t=96 and beyond are expected to be in the DDNAME=F96 file.

If one chooses to have data plots only (IC=4), permitted (see above) map number combinations from Table 2 or Table 3 must still be specified on Card 1, VSETUP. Internally, a switch will be tested in the VARIAN program and will cause a bypass of the contouring subroutine.

Table 5. Format of Input Cards for DATA20 or DESUAPAP (//SYSIN DD *):

Card 1.

Column 1, 1 signifies first card.
 Columns (3 - 72, free form) KRUN=XXXXXX, NLVLS=N, IOPTN=1;
 where: XXXXXX is a data prep file name selected
 from Table 4,
 N is the number of levels where data
 should be prepared for plotting,
 IOPTN=1; (do not change).

Card 2.

Column 1, 2 signifies second card.
Columns (3 - 72, free form) pppMB, pppMB, pppMB, etc. ;
where ppp's are set to the specific pressure levels
(there should be N entries, terminated with a semicolon).

Card 3.

Columns 1 - 3, 999 signifies last card.

TIROS Data

TIROS data files in NMC Office Note 29 format are not normally saved on any of run history tapes. However, the directories associated with the data dumps for the LFM, OPNL and FINAL runs are saved on the respective run history tapes, and the TIROS data in NMCEDS format is dumped to file 2 of the FINAL run history tape every 12 hours. But remember, all the run history tapes are overwritten monthly. A program (DEST29ZT) is available to process the TIROS data to O. N. 29 format from history tapes or from disk files (See Desmarais, or see Appendix A7).

Aircraft Data Plots

The data plotting preprocessor selects aircraft reports to be plotted at the various pressure levels according to the following altitude ranges:

<u>Altitude (ft)</u>	<u>Level (mb)</u>
2,900 - 7,000	850
7,000 - 12,000	700
15,000 - 20,000	500
27,900 - 34,000	300
32,000 - 38,000	250
34,000 - 41,000	200

VARIAN output file

The output file from the VARIAN program (See VARIANX procedure, Appendix A4) will be on FTO1F001 and will be on a non-labelled 7-track tape by default. However, the file can reside on other devices, depending on what the user intends to do with the output that still has to be processed. The output file consists of many records that specify the instructions to the VARIAN recorder which is driven by a minicomputer on the 4th floor, WWB. This same file can be processed by a minicomputer in the OMCS Graphics Support Section to provide images on 35-mm film from 7- or 9-track tapes. The user can set the various output file parameters in the VARIANX procedure from the following table:

<u>UNIT</u>	<u>VOUT</u>	<u>DEN</u>	<u>TRTCH</u>	<u>TFILE</u>	<u>DSN</u>
TAPE9	user tape	DN=2	CH=''	u/s	Not required
NMCTP9	" "	DN=2	CH=''	u/s	" "
DISK	NWS255	DN=''	CH=''	n/u	TDSN='NWS.VFIL.Wxxx.name' where: xxx is user routing code, name is 1-8 characters
TAPE7	user tape	DN=2	CH=C	u/s	Not required

Note: n/u indicates not used; u/s = user specified.

TAPE7 and TAPE9 tapes have to be available in the OMCS tape library; NMCTP9 tapes must reside in the NMC library on the 3rd floor, FOB4, and are normally assigned to individuals for specific functions. If you need an NMCTP9 tape number, call Bill Glidewell, 763-5813, -- or maybe you can use someone else's tape number if it is not being used.

Automation Division has reserved some space on an online disk (NWS255) that can be used as a temporary staging area for files scheduled to be transferred, via the channel-to-channel interface (CTC), to the 3rd floor for semi-automatic hard copy processing. One should not catalog any data sets on NWS255 unless approved by Automation Division (Howcroft 763-8115). If DISK is selected to store the VARIAN output, the user must make sure that the last execution of the VARIANX procedure has either DISP=(NEW,KEEP) or DISP=(MOD,KEEP). Intermediate executions should have DISP=(MOD,PASS) if the output files are being concatenated. If the last KEEP is not specified the system will delete the disk file upon termination of the job (See sample JCL in Appendix 5 and 6).

Once all the codes have run, the user still has to determine the final steps to get the desired graphics...take you choice (and there are others):

<u>VARIAN output is on</u>	<u>To get 35-mm film</u>	<u>To get VARIAN Charts</u>
User TAPE7	Use WRTMIC Proc.	Use Copy TAPE7 to NMCTP9, or Use Copy TAPE7 to DISK and WWUPSTRS Proc.
User TAPE9	Use WRTMIC Proc.	Use Copy TAPE9 to NMCTP9, or Use Copy TAPE9 to DISK and WWUPSTRS Proc.
User NMCTP9	Copy from NMCTP9 to TAPE9, and use WRTMIC Proc.	Call NMC operator (763-5995) for VARIAN processing, and specify the number of maps expected. Most processes have IDENT=000 and one pass; hemi- spheric 1:20 million (SIRSLOT) maps need 2 passes with IDENT= 000 and 248.
DISK(NWS255)	Copy to TAPE9 prior to using WWUPSTRS proc., and use WRTMIC Proc.	Use WWUPSTRS.

The procedure WWUPSTRS (See sample, Appendix A5) will transfer a file from a specified disk pack to a reserved area on an NMC disk pack for semi-automatic processing. The designated NMC file names for checkout VARIAN are VFIL for single-pass maps and VFIL2 for 2-pass maps like the hemispheric 1:20 million SIRSLOT maps. If space is not available on the NMC disk, the monitor system will copy the disk file to the designated NMCTP9 backup tape. The operator will process the backup tape after the files already in VFIL or VFIL2 have been processed and only if the processing does not interfere with operational VARIAN products or NMC digitizing. After a successful transfer of the user's disk file to NMC, the WWUPSTRS procedure will delete the user's disk file on the specified disk pack. IMPORTANT: the space available for VFIL or VFIL2 on the NMC disk pack is rather limited and should be able to accommodate about 10 maps, depending on how dense the images will be. If one needs more than 10 or so maps on hard copy, break up the processing into separate jobs. This limit does not apply to 35-mm film graphics.

WRTMIC Procedure

A sample JCL for the WRTMIC procedure follows:

```
//FILM EXEC WRTMIC, JOB=WEK, NAME=DESMARAIS, COCI='763-8161'
//   RTCDE='WWB4-D3, RM 202, W324', LAB=' 7T BLP', MM=35MM,
//   PRG='NEW VARIAN', TAPE='DA9999'
```

Copy Routine

Copying VARIAN output files from one device to another can be done using the IBM utility program IEBCGENER (needs about 70K):

Example 1. TAPE7 to NMCTP9 (or to TAPE9)

```
//COPY EXEC PGM=IEBCGENER
//SYSPRINT DD SYSOUT=A
//SYSIN DD DUMMY
//SYSUT1 DD DISP=(OLD,PASS), UNIT=TAPE7, LABEL=(1, BLP, , IN),
//   DCB=(RECFM=F, LRECL=1440, BLKSIZE=1440, TRTCH=C, DEN=2),
//   VOL=SER= ...user tape number, input
//SYSUT2 DD DISP=(NEW,PASS), UNIT=NMCTP9, LABEL=(1, BLP, , OUT),
//   DCB=(RECFM=F, LRECL=1440, BLKSIZE=1440),
//   VOL=SER= ...user tape number, output
//
```

Example 2. TAPE7 to DISK

```
// --- same as above, except
//SYSUT2 DD DISP=(NEW,KEEP), UNIT=DISK, VOL=SER=NWS255,
//   DCB=(RECFM=F, LRECL=1440, BLKSIZE=1440), SPACE=(CYL,10),
//   DSN=NWS.VFIL.W324.DESMAPS (use your routing code and short name)
```

Example 3. DISK to NMCTP9 (or TAPE9)

```
//COPY EXEC PGM=IEBGENER
//SYSPRINT DD SYSOUT=A
//SYSIN DD DUMMY
//SYSUT1 DD DISP=(OLD,DELETE),UNIT=DISK,VOL=SER=NWS255, (OR OLD,PASS)
// DCB=(RECFM=F,LRECL=1440,BLKSIZE=1440),
// DSN=NWS.VFIL.W324.DESMAPS (example only)
//SYSUT2 DD DISP=(NEW,PASS),UNIT=NMCTP9,LABEL=(1,BLP,,OUT),
// DCB=*.SYSUT1,VOL=SER= ...user tape number
//
```

April 14, 1981

TO : Recipients of NMC Office Note 230
FROM : OA/W324 - A. J. Desmarais *A.J.D.*
SUBJECT: Correction for Table 3, NMC Office Note 230

Map numbers 621, 634, 642, 829 and 830 as specified in Table 3 (page 5) of NMC Office Note 230 were incorrectly assigned to Trop. Streams and Trop. Isotachs. These numbers should be assigned to Precip. Amt. for the same time periods.

Kindly make a correction to Table 3 or replace page 5 with a corrected version (attached).
